

Our group plans to work together via branches in Github. Before each Sprint we will coordinate what is being worked on by each team member. Then, each member will complete work in each change's branch, before merging into the Sprint branch once changes are tested by "make doc-view".

Our goals for the project are split into four parts:

1. Consolidate the information related to Augur setup
 - a. Remove outdated information
 - b. Place updated information into one place at start of documentation
2. Make copying commands easier
 - a. Remove terminal prompt from commands
 - b. Add copy button
3. Reorganization of table of contents
 - a. Remove old setup tabs
4. Add documentation about testing documentation changes
 - a. Skipping configuration
 - b. make doc-view
